

1 **ABSTRACT OF THE DISCLOSURE**

2 Methods, systems, computer program products, and data structures for displaying
3 data on a web browser interface where the data in its native format is not displayable on a
4 web browser interface. A network server receives a request for content from a network
5 device where the request includes a request for data that is not displayable on a web
6 browser. The network server identifies a template, which will be used to transform non-
7 displayable data into displayable content. The network server accesses non-displayable
8 data that is stored on a data server and processes the accessed non-displayable data
9 according to the identified template in order to transform it into displayable content. A
10 template may include HTML code as well as customized tags. The customized tags are
11 consumed by a rendering engine, which executes certain functions to modify the data,
12 making it displayable content. Once transformed, displayable content is sent to the
13 network device.
